Cinema Booking System

Screenshot Walkthrough & Page Relationships

This document walks through every screen of the Cinema Booking System (ASP.NET Core MVC), grouped by module, and explains how the modules relate to one another through the data they share.

Overview: How the Pages Relate

The system is built around six entities. Each arrow below shows a foreign-key style dependency: the entity on the right cannot exist meaningfully without the one(s) on the left.

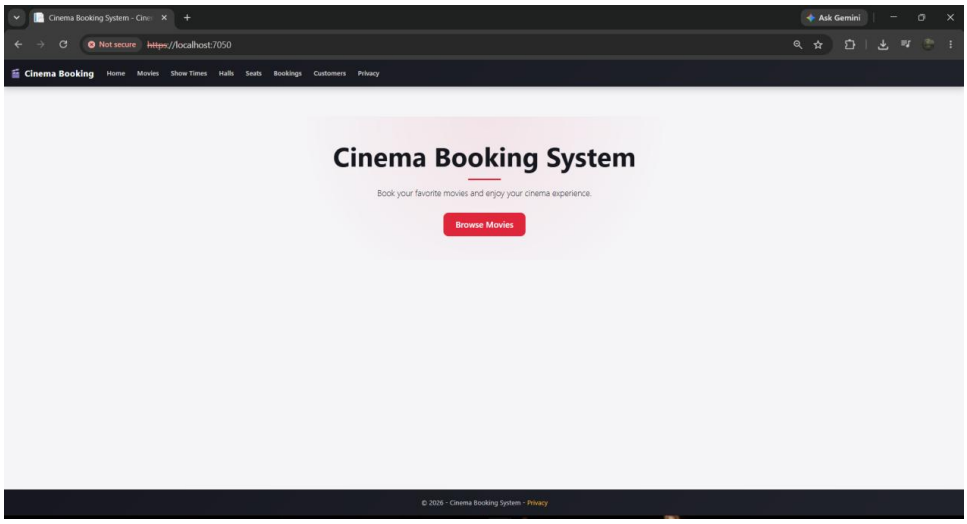

- Movie -> Show Time: a Show Time always belongs to exactly one Movie.
- Cinema Hall -> Show Time: a Show Time always takes place in exactly one Cinema Hall.
- Cinema Hall -> Seat: every Seat is assigned to exactly one Cinema Hall.
- Customer + Show Time + Seat -> Booking: a Booking is the join of these three; it is the only entity that ties Customers to Movies/Halls/Seats.
- Customer -> Bookings (Details page): the Customer Details screen lists every Booking that customer has made, proving the one-to-many link.
- Seat + Show Time uniqueness: the Create/Edit Booking forms enforce that the same seat cannot be double-booked for the same show time (see the validation screenshot in the Bookings section).

In short: Movies and Cinema Halls are independent root entities. Show Times and Seats each depend on one root entity. Bookings depend on all of them at once, and Customers are the only entity outside this chain that connects into it purely through Bookings.

1. Home Page

The landing page of the site. It links out to every other module through the top navigation bar.

Home

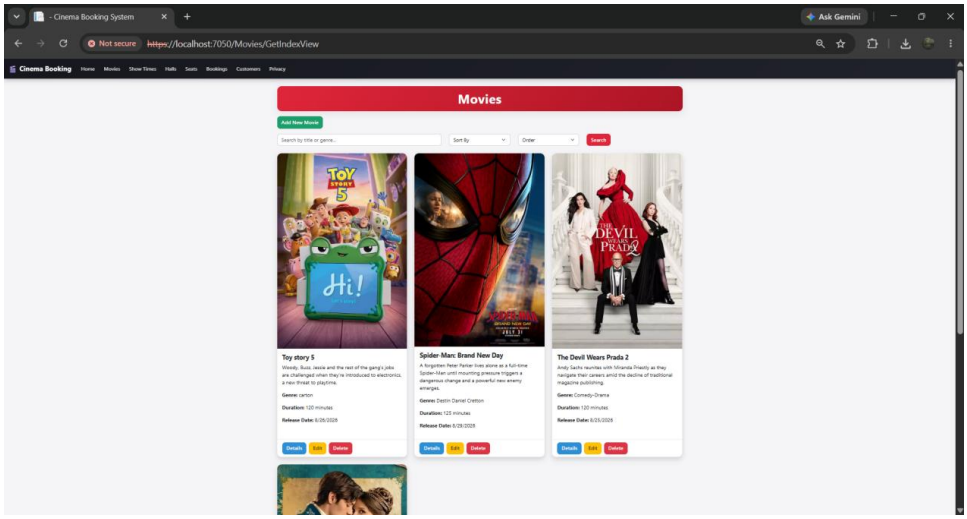

Landing page with the site title and a "Browse Movies" call-to-action button. Entry point that links to Movies and every other module via the navbar.

2. Movies

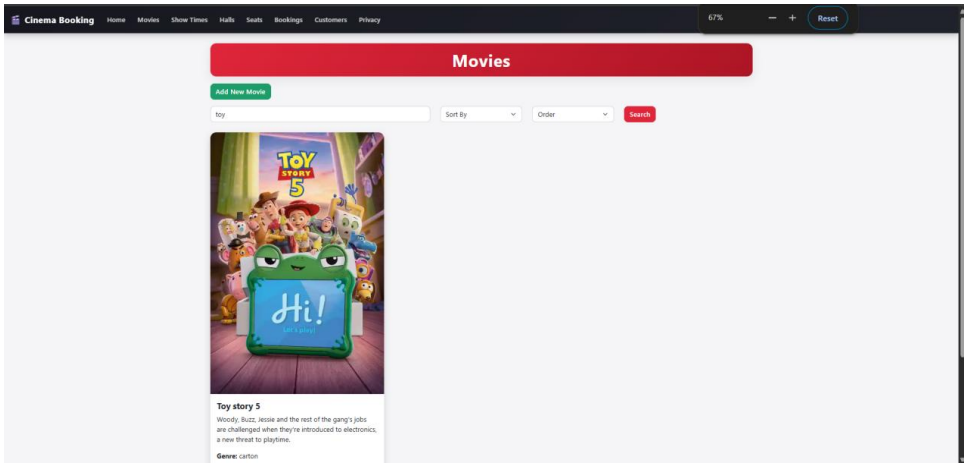

Movies are the root entity of the system: every Show Time is created for a specific Movie.

Movies - Index

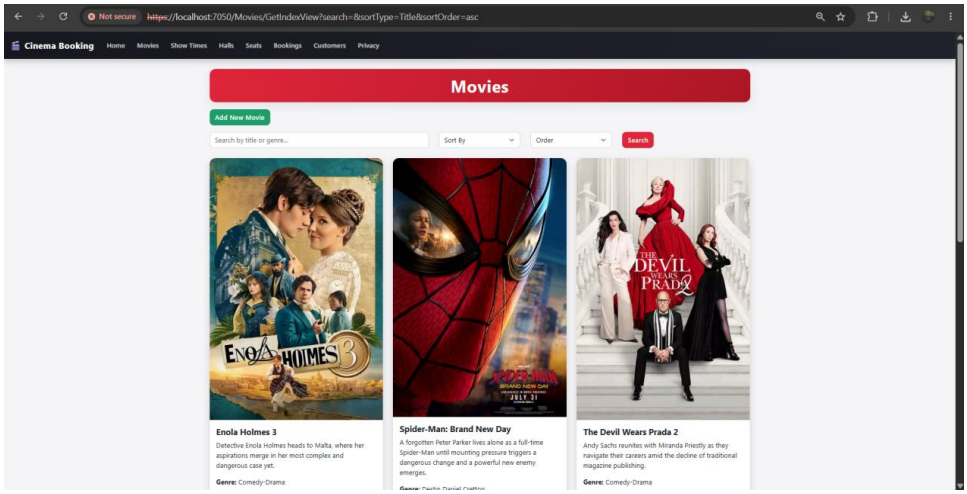

Grid of movie cards (poster, description, genre, duration) with search, sort and order controls. Each card links to Details, Edit and Delete for that movie.

Movies - Search filter

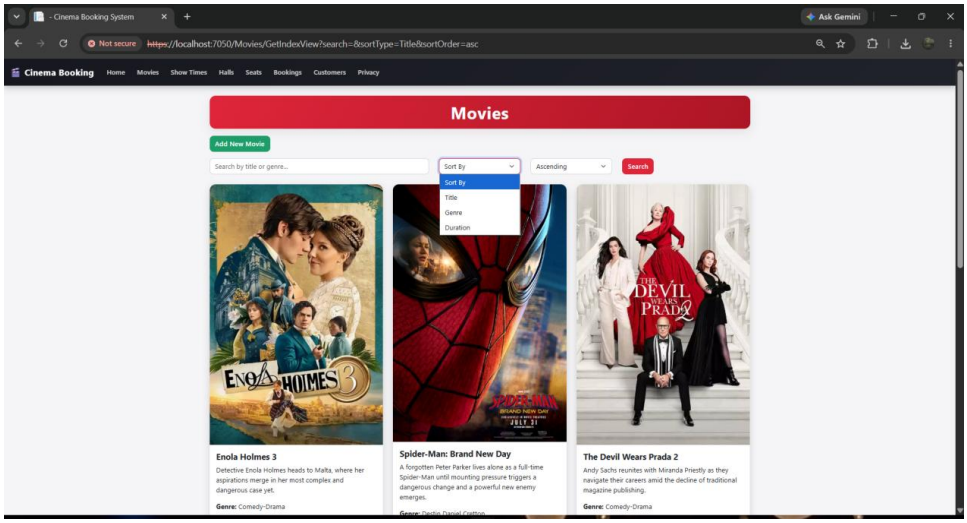

Same index page filtered by the keyword "toy", returning only "Toy Story 5". Shows the live search box narrowing the movie grid.

Movies - Sorted by Title (ascending)

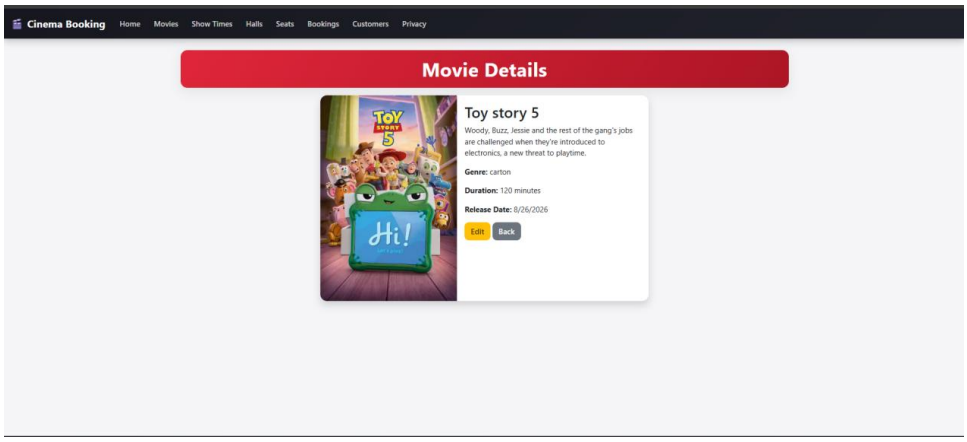

Movie list re-ordered alphabetically by title, visible in the URL query string. Demonstrates the Sort By + Order controls working together.

Movies - Sort By dropdown open

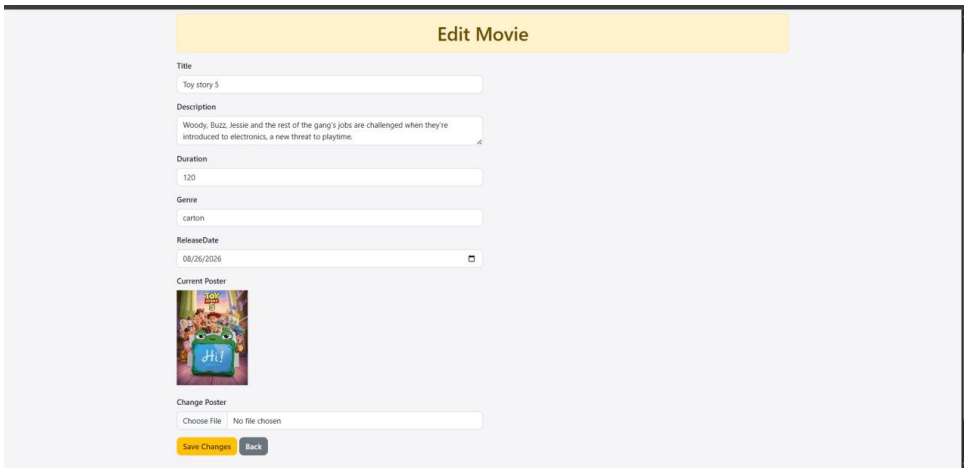

The "Sort By" dropdown expanded, showing Title, Genre and Duration as options. Lets the user pick which field drives the ordering above.

Movies - Details

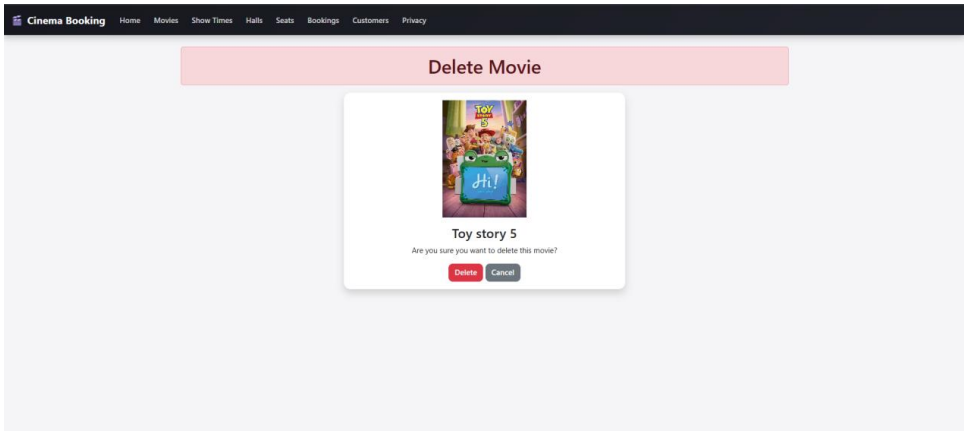

Read-only detail view of a single movie: poster, description, genre, duration and release date. Links onward to Edit or back to the Movies index.

Movies - Edit

Edit form for a movie's title, description, duration, genre, release date and poster image. Saving returns the user to the movie's Details/Index view.

Movies - Delete confirmation

Confirmation dialog before permanently deleting a movie. Deleting a movie cascades logically to its Show Times.

3. Cinema Halls

Cinema Halls are an independent entity referenced by both Show Times and Seats.

Halls - Index

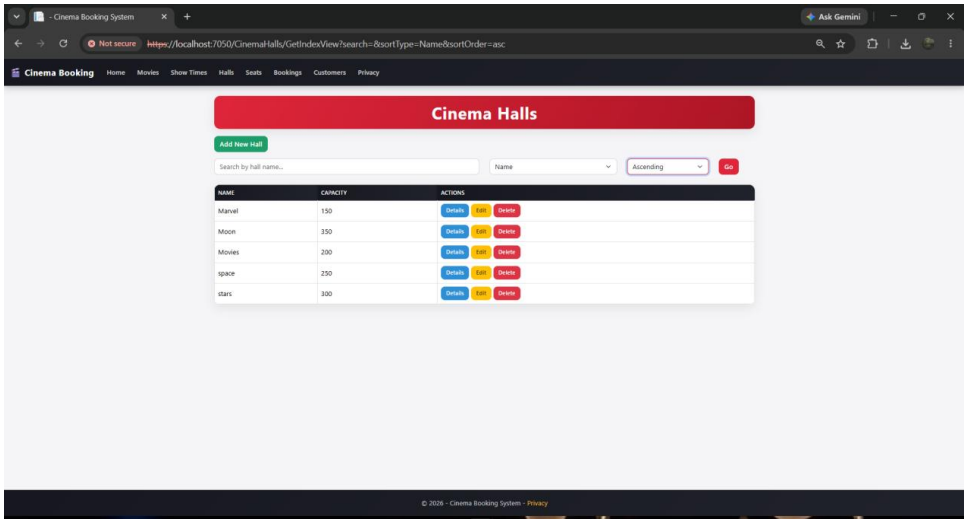

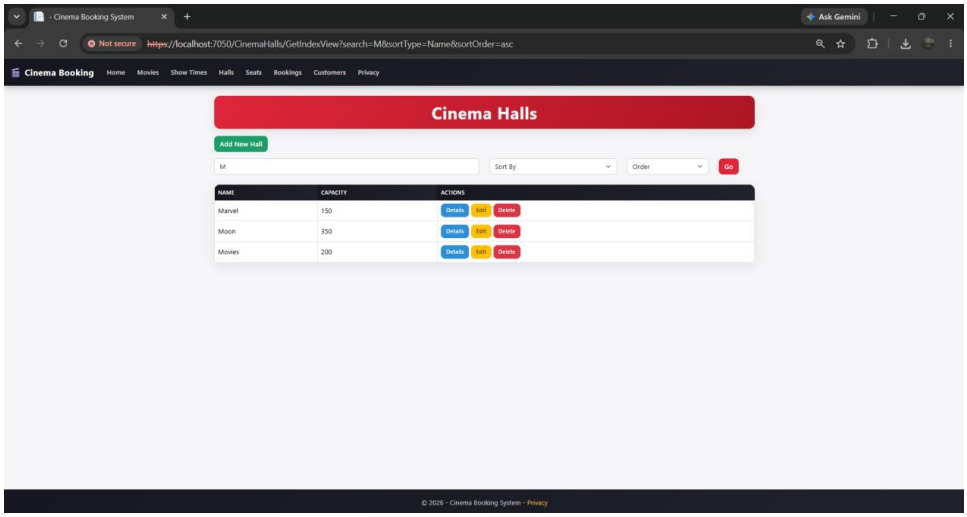

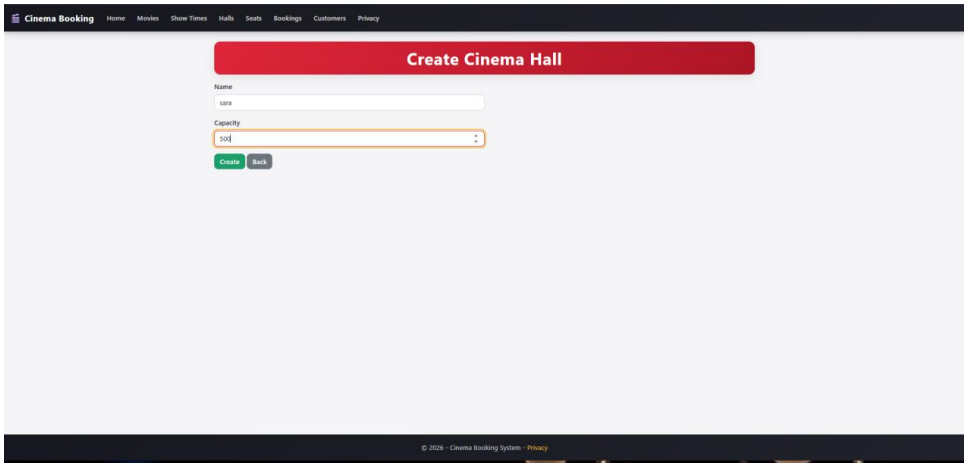

Table of cinema halls with name and seating capacity, sorted ascending by name. Each row exposes Details, Edit and Delete actions.

Halls - Search filter

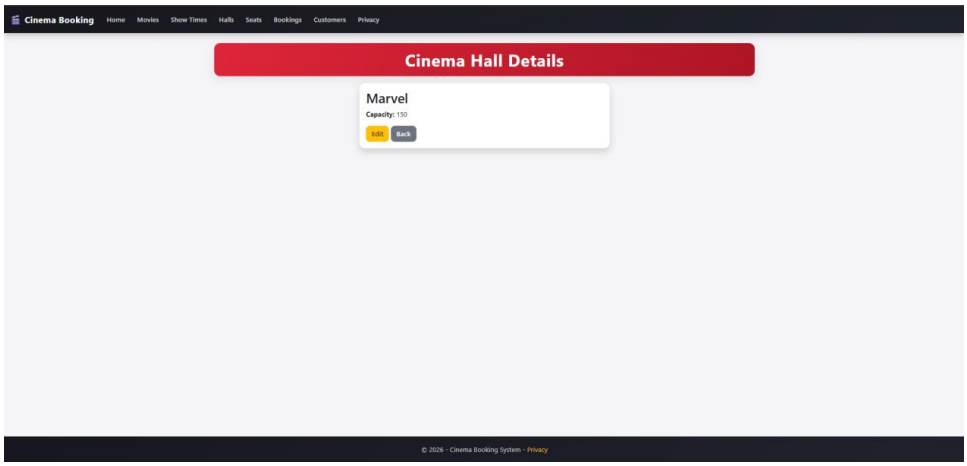

Hall list filtered by the letter "M", returning Marvel, Moon and Movies. Same search pattern reused across the Halls module.

Halls - Create

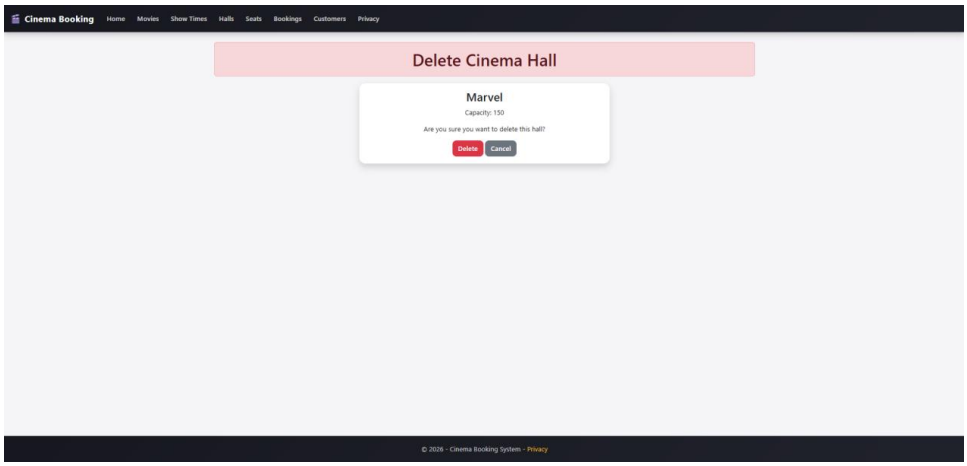

Form to add a new cinema hall by entering its name and capacity. Once created, the hall becomes selectable when creating Show Times or Seats.

Halls - Details

Read-only view of a single hall's name and capacity. Links to Edit or back to the Halls index.

Halls - Delete confirmation

Confirmation dialog before deleting a hall. A hall in use by Show Times or Seats should be protected from deletion at the data level.

4. Show Times

A Show Time links one Movie to one Cinema Hall at a specific date and time; it is the entity Bookings are made against.

Show Times - Index

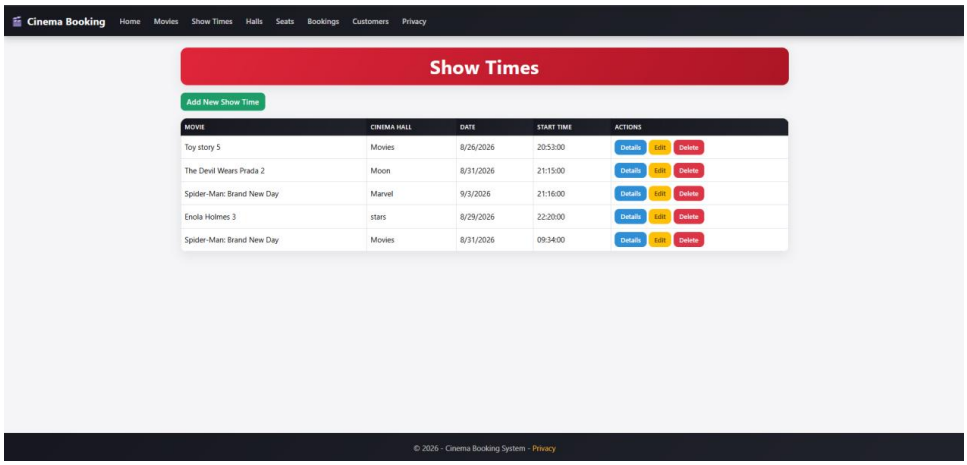

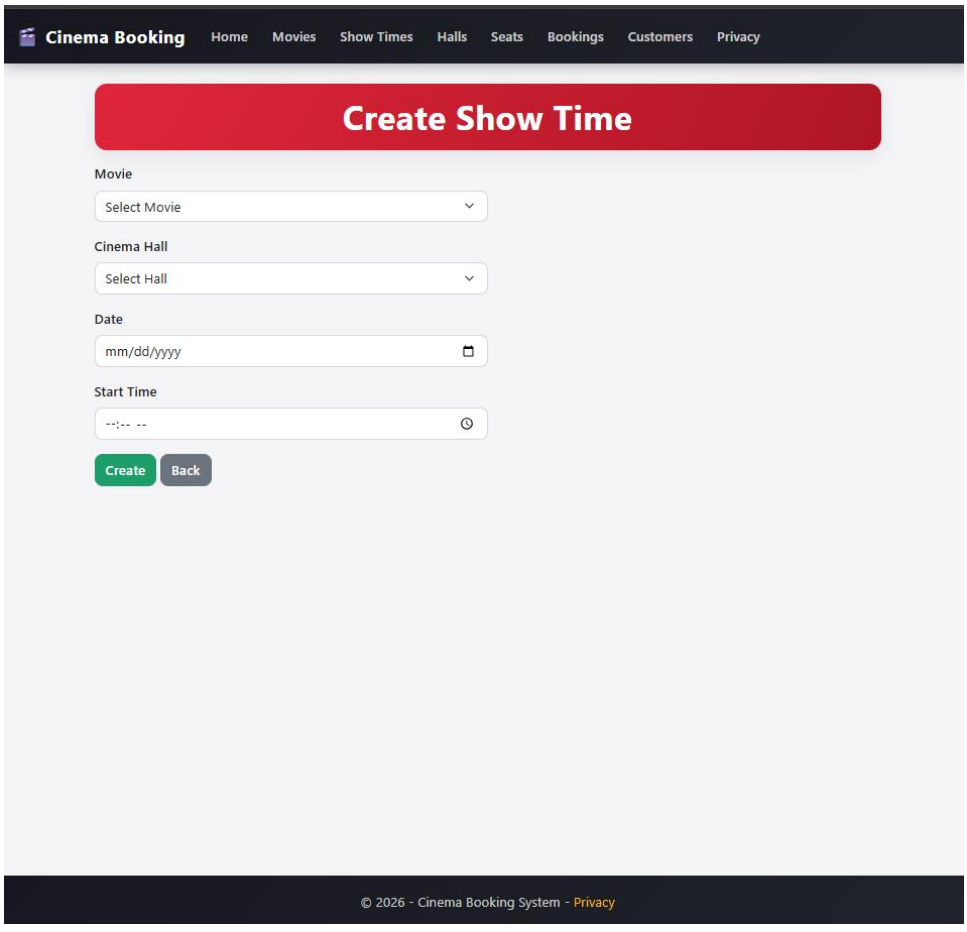

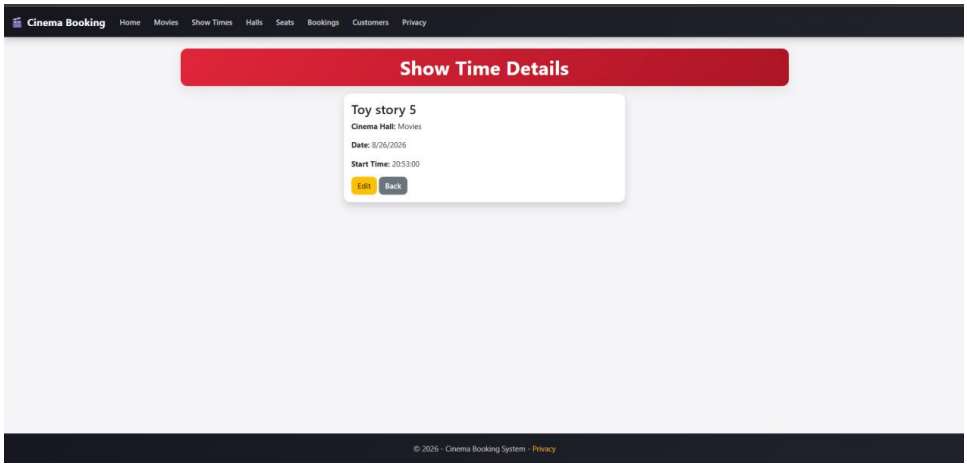

Table listing every show time with its movie, hall, date and start time. Acts as the bridge between the Movies and Halls modules.

Show Times - Create

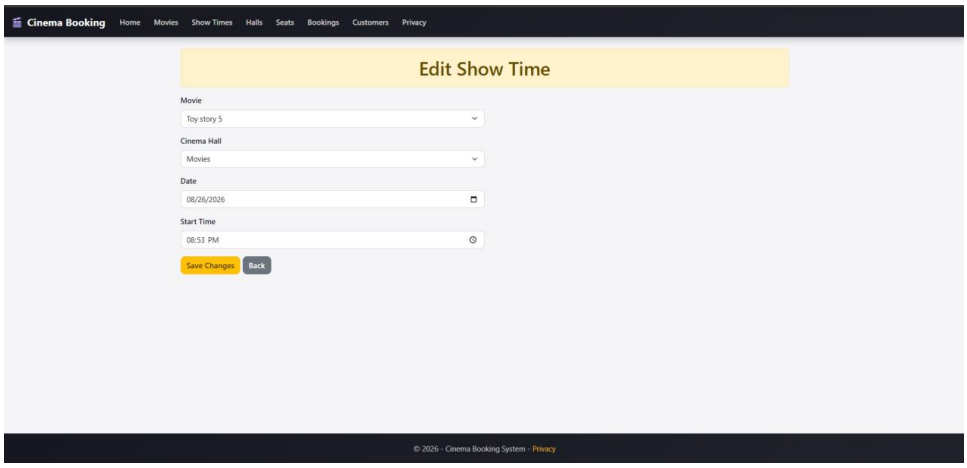

Form to schedule a new show time by choosing a Movie, a Cinema Hall, a date and a start time. Both dropdowns pull their options directly from the Movies and Halls tables.

Show Times - Details

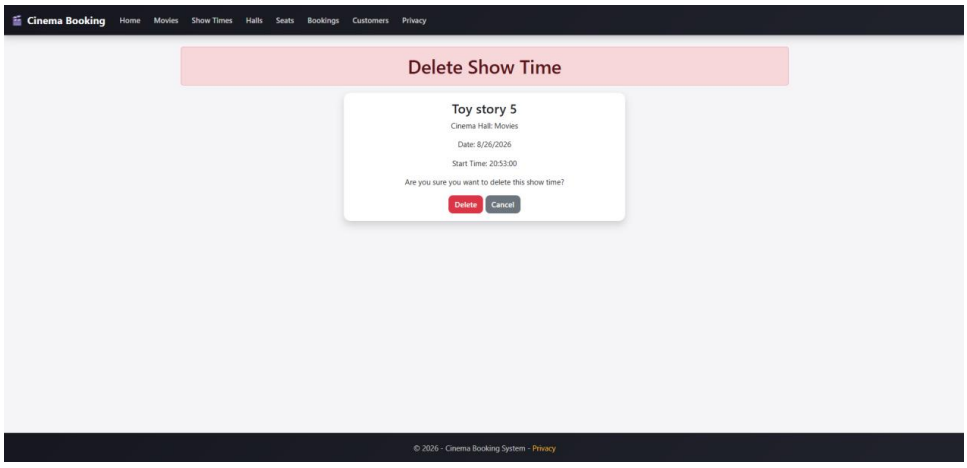

Read-only detail card for a single show time (movie, hall, date, start time). Links to Edit or back to the Show Times index.

Show Times - Edit

Edit form allowing the movie, hall, date and start time of a show time to be changed. Any existing bookings for this show time stay linked by its ID.

Show Times - Delete confirmation

Confirmation dialog before deleting a show time. Deleting it should also invalidate any Bookings made for that slot.

5. Seats

Seats belong to a Cinema Hall and are the third input (alongside Customer and Show Time) required to create a Booking.

Seats - Index

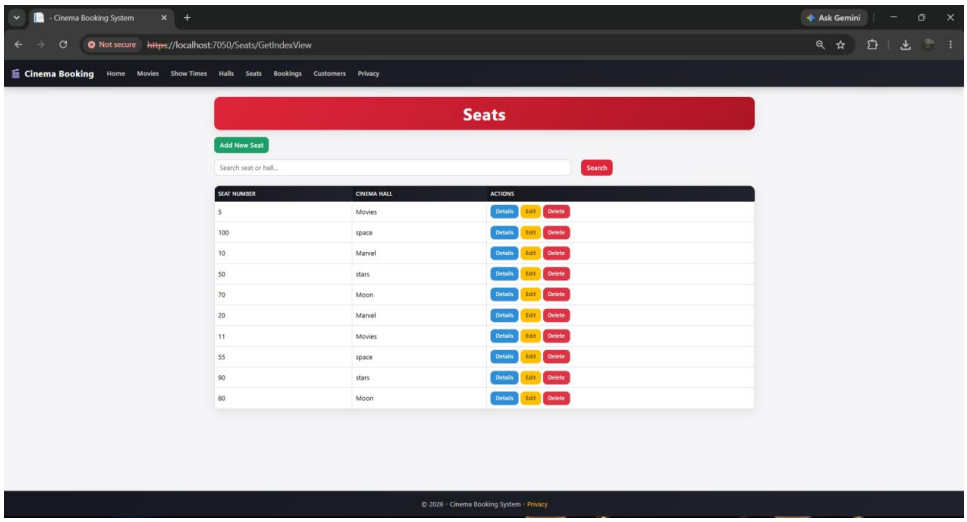

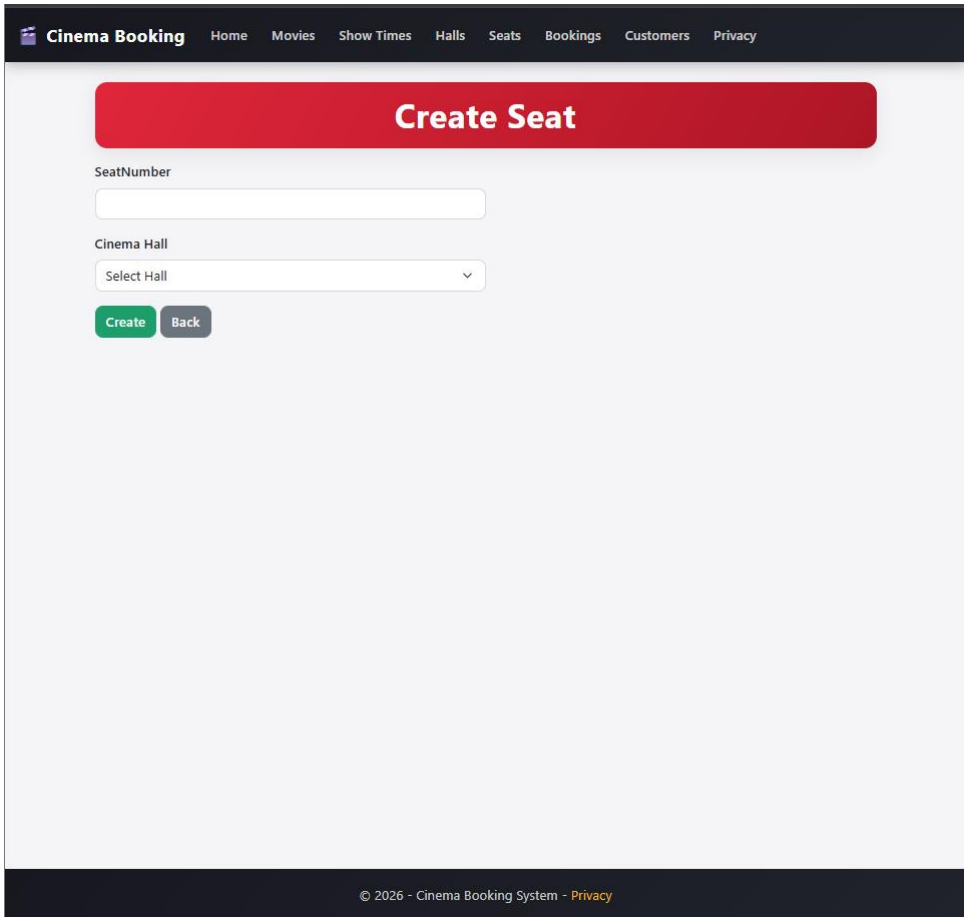

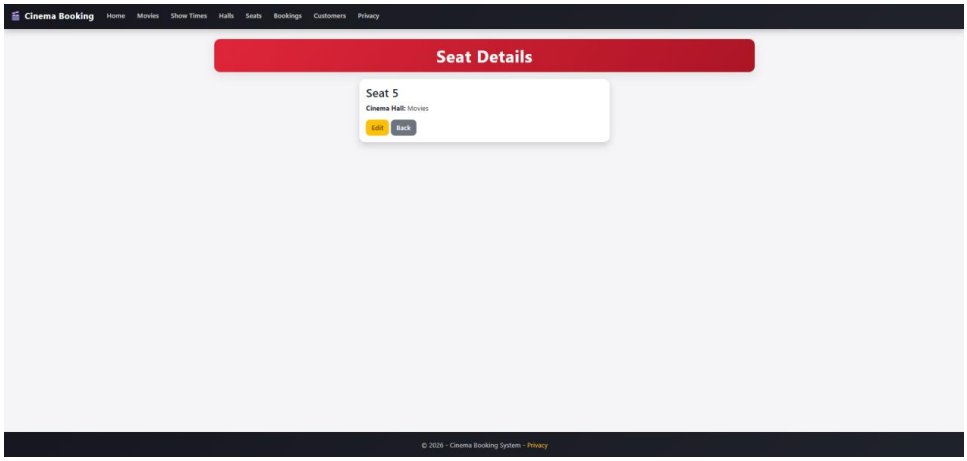

Table of seats showing seat number and the hall each seat belongs to, with search. Each seat can later be picked when creating a Booking for a show time in that hall.

Seats - Create

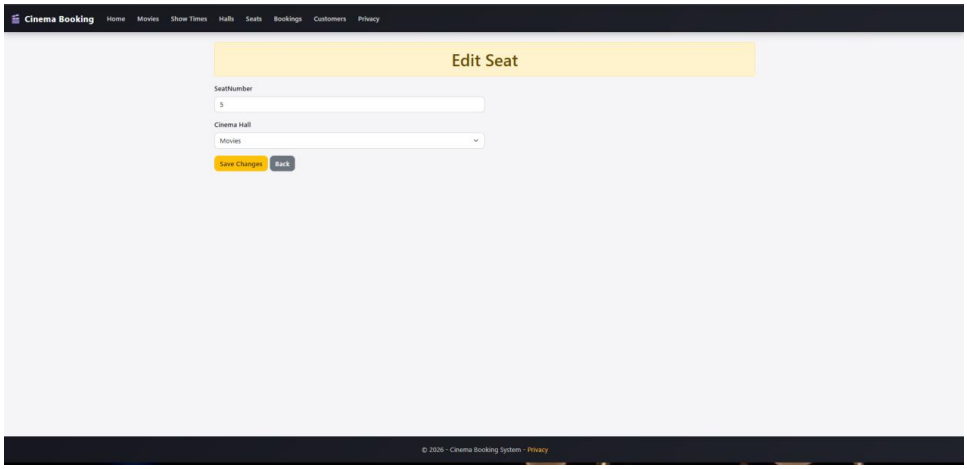

Form to add a new seat by entering its seat number and selecting its Cinema Hall. Ties directly into the Halls module through the hall dropdown.

Seats - Details

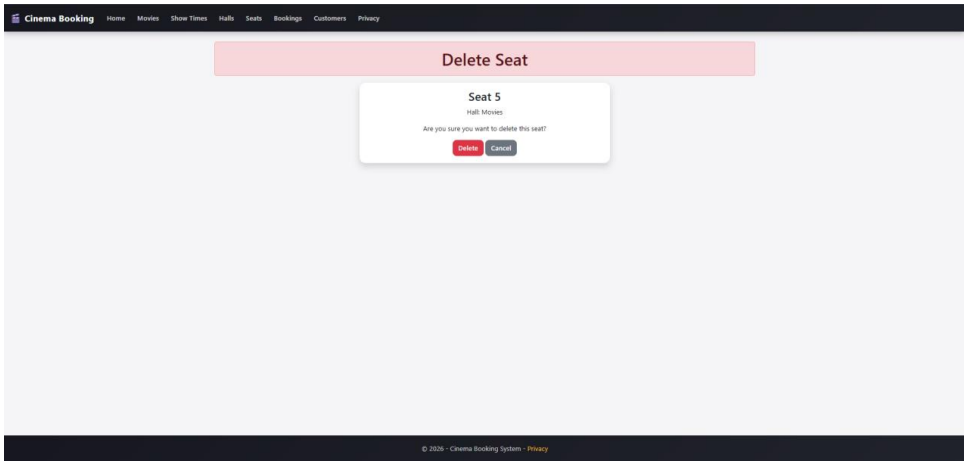

Read-only view of one seat: its number and the hall it sits in. Links to Edit or back to the Seats index.

Seats - Edit

Edit form for changing a seat's number or reassigning it to a different hall. Saving updates the seat referenced by any of its existing bookings.

Seats - Delete confirmation

Confirmation dialog before deleting a seat. A seat already tied to a booking should be protected from deletion.

6. Bookings

A Booking is the central transaction of the system: it connects one Customer, one Show Time and one Seat.

Bookings - Index

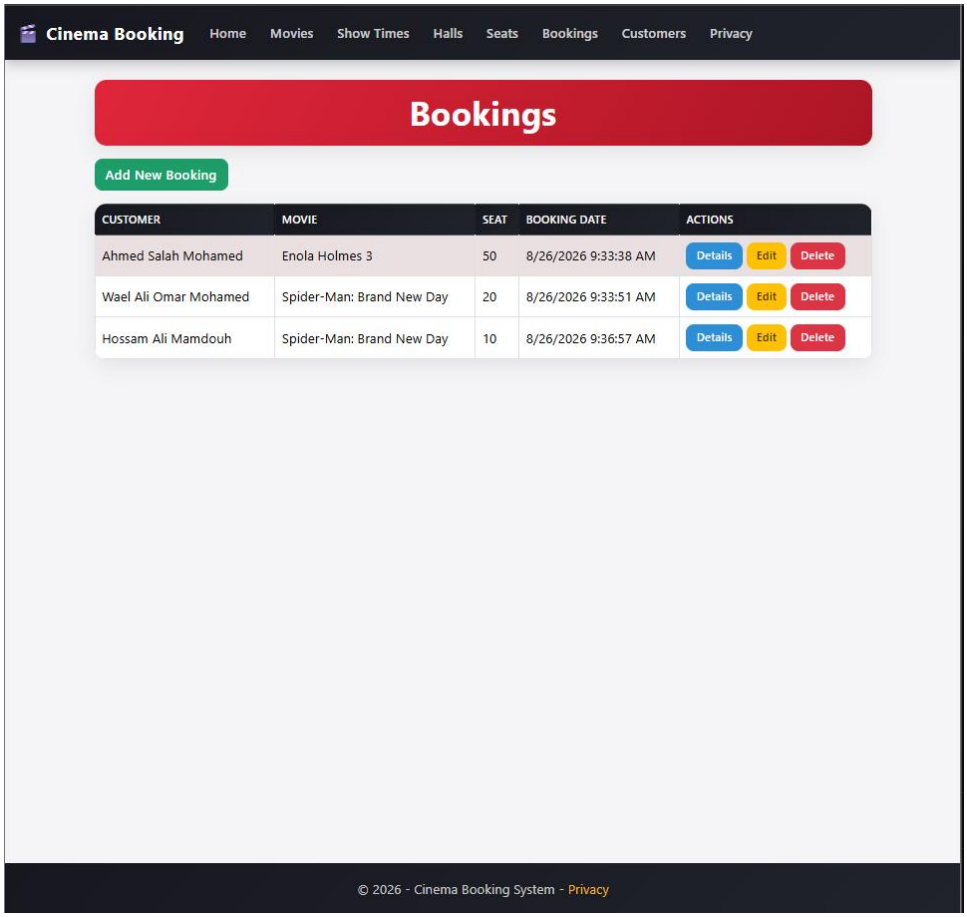

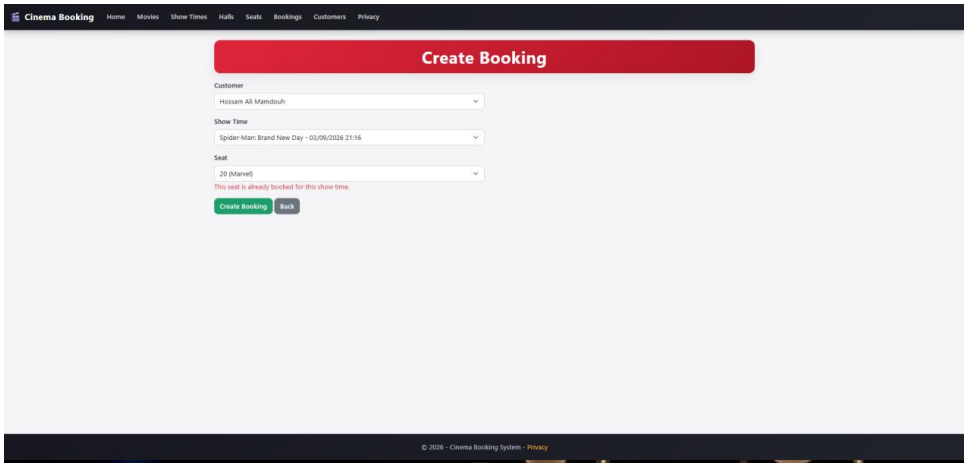

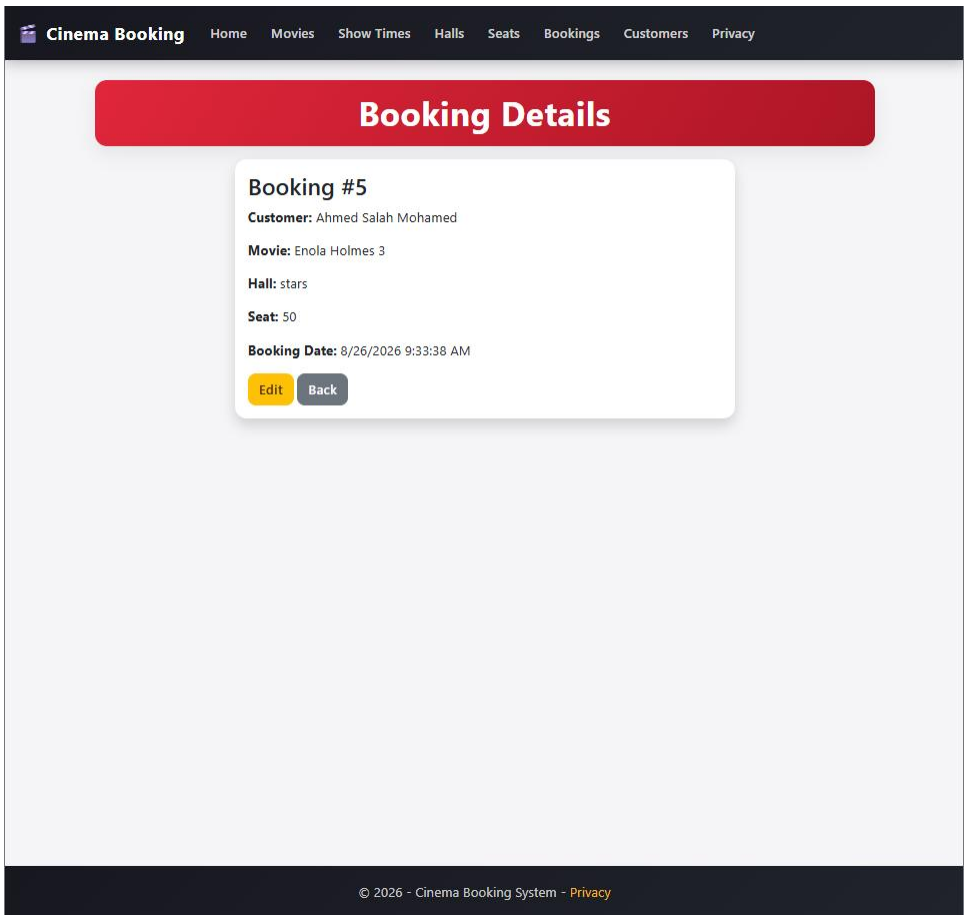

Table of all bookings showing customer, movie, seat and booking date/time. The single view that ties Customers, Movies (via Show Times) and Seats together.

Bookings - Create (validation error)

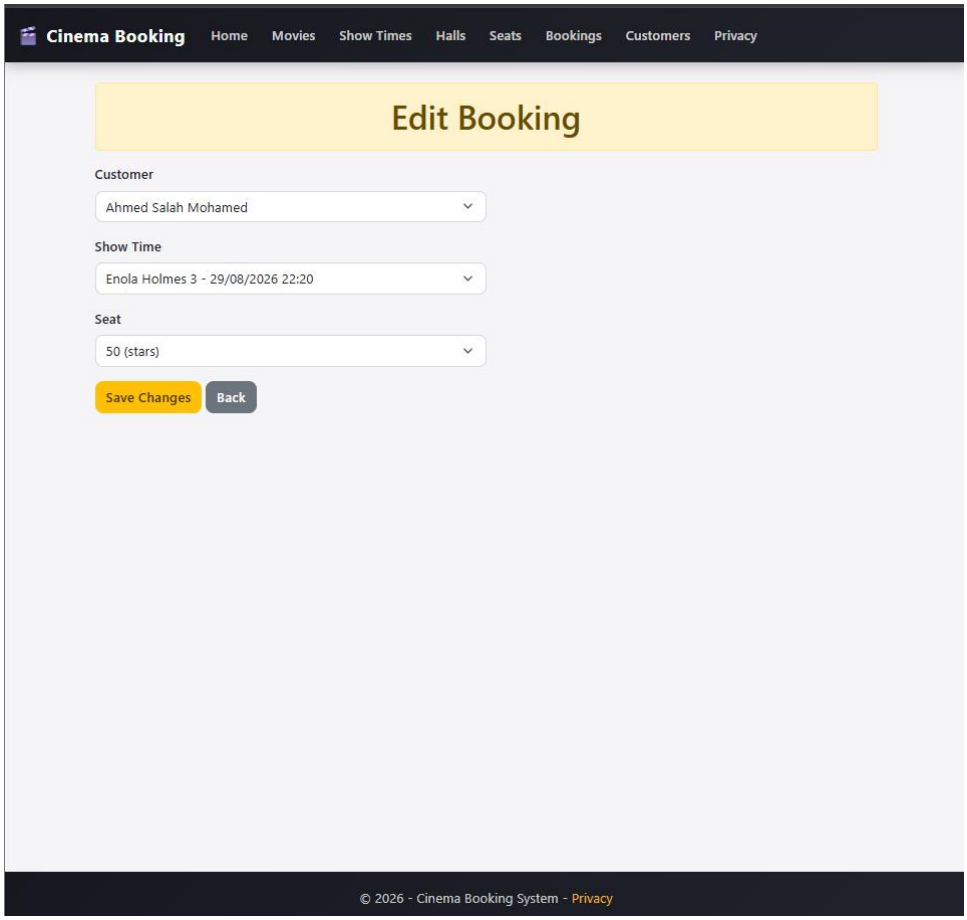

Create Booking form with Customer, Show Time and Seat dropdowns. Shows server-side validation blocking a duplicate booking: "This seat is already booked for this show time."

Bookings - Details

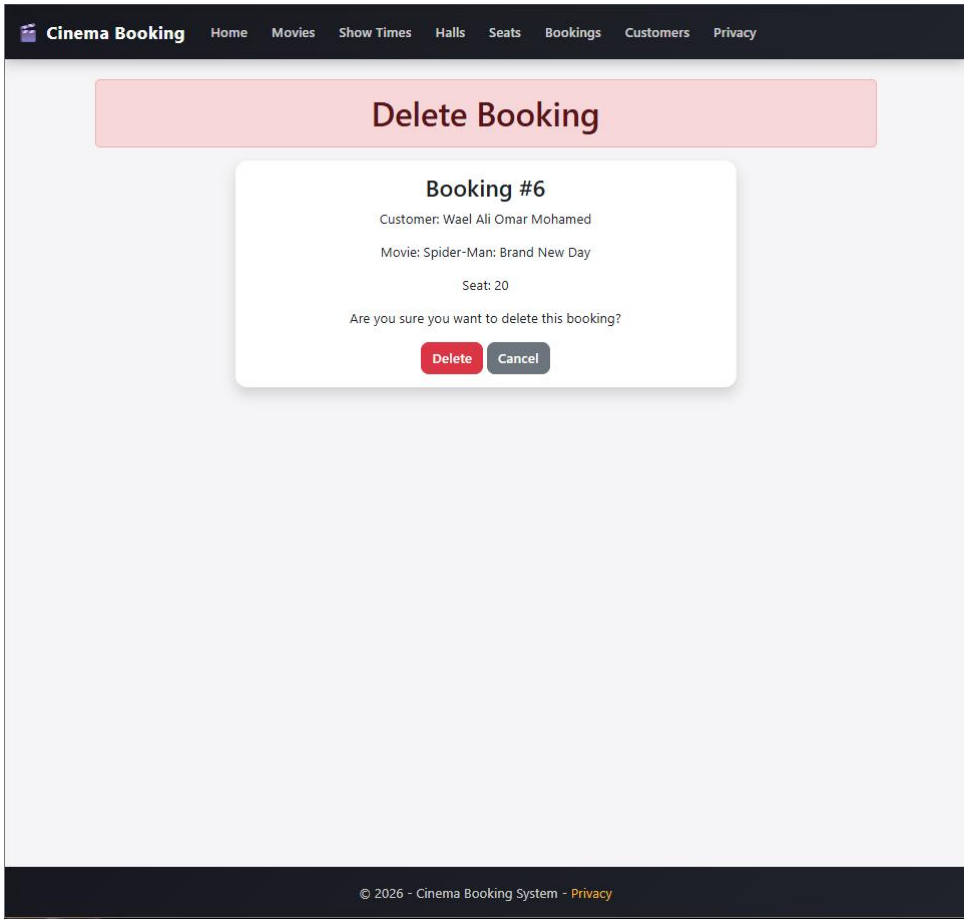

Read-only detail card for one booking, showing customer, movie, hall, seat and booking timestamp. Confirms the full chain: Customer -> Show Time (Movie + Hall) -> Seat.

Bookings - Edit

Edit form letting the customer, show time or seat of an existing booking be changed. Re-uses the same three dropdowns as the Create Booking form.

Bookings - Delete confirmation

Confirmation dialog before deleting a booking, summarizing customer, movie and seat. Deleting a booking frees up that seat for the same show time again.

7. Customers

Customers are the people who make Bookings; a customer's detail page rolls up all of their bookings.

Customers - Index

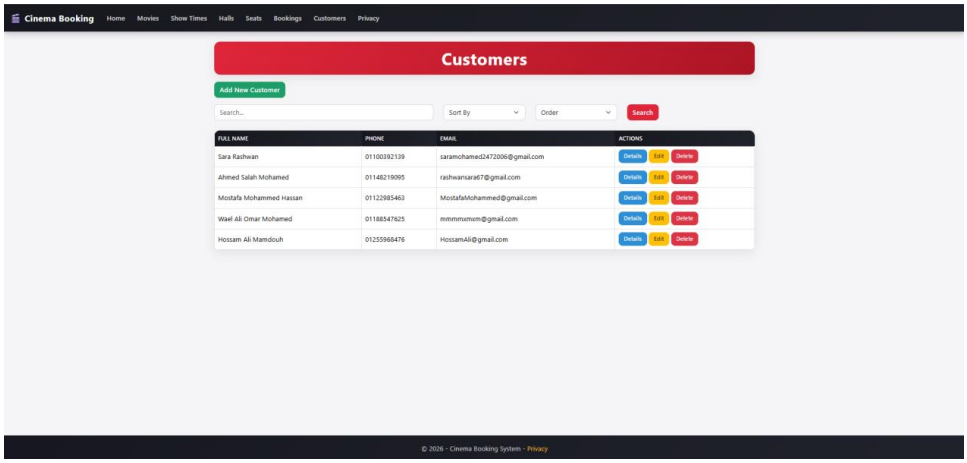

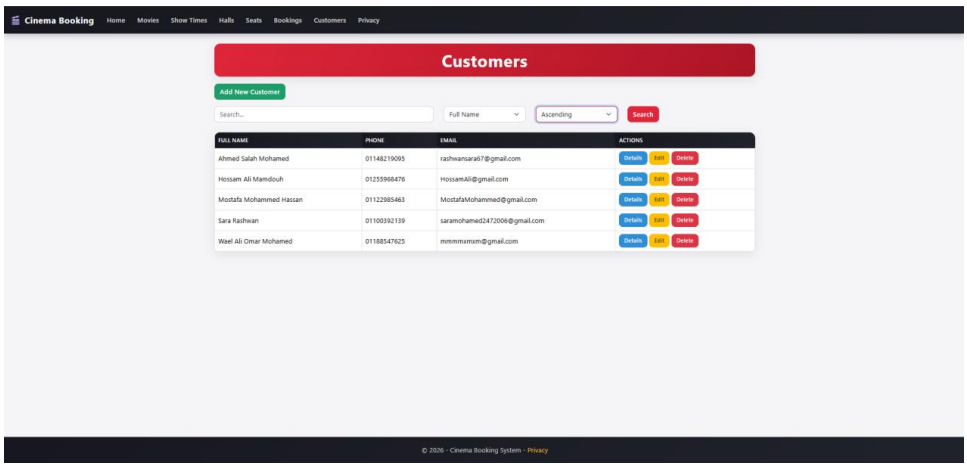

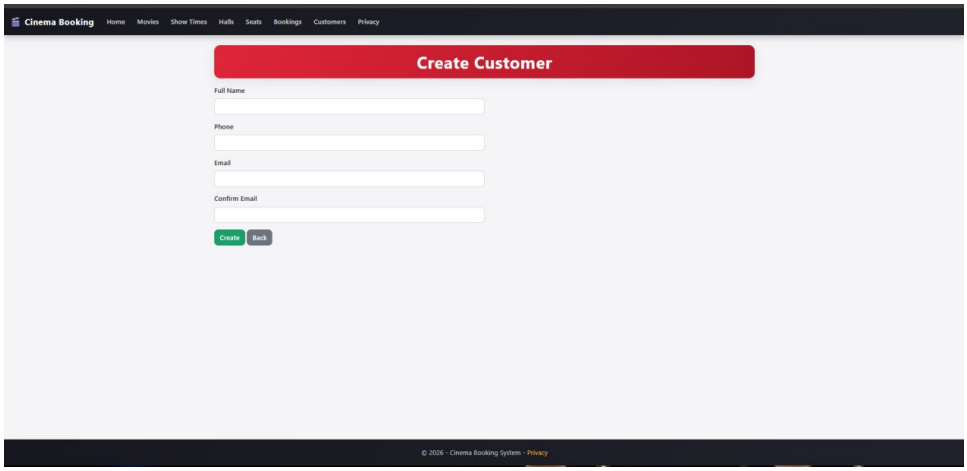

Table of customers with full name, phone and email, plus search and sort controls. Each customer can be linked to one or more Bookings.

Customers - Sorted by Full Name (ascending)

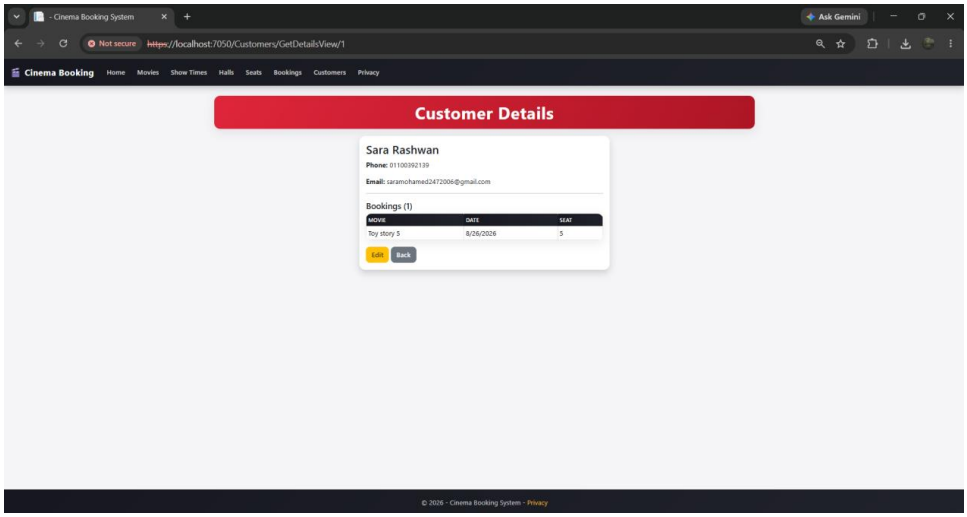

Same customer list re-ordered alphabetically by full name. Uses the same Sort By / Order pattern seen in Movies and Halls.

Customers - Create

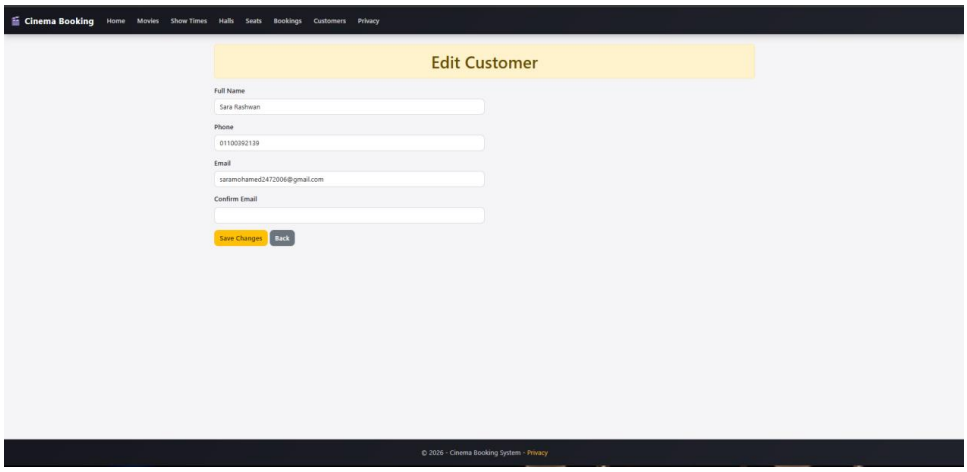

Form to register a new customer with full name, phone, email and email confirmation. Once created, the customer becomes selectable in the Create Booking form.

Customers - Details

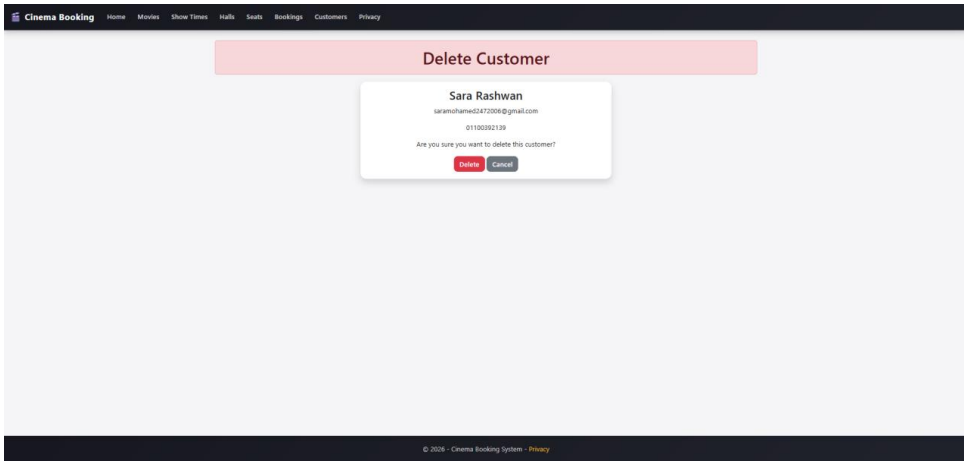

Customer profile showing phone and email, plus a nested table of that customer's bookings. Directly demonstrates the one-to-many relationship between Customers and Bookings.

Customers - Edit

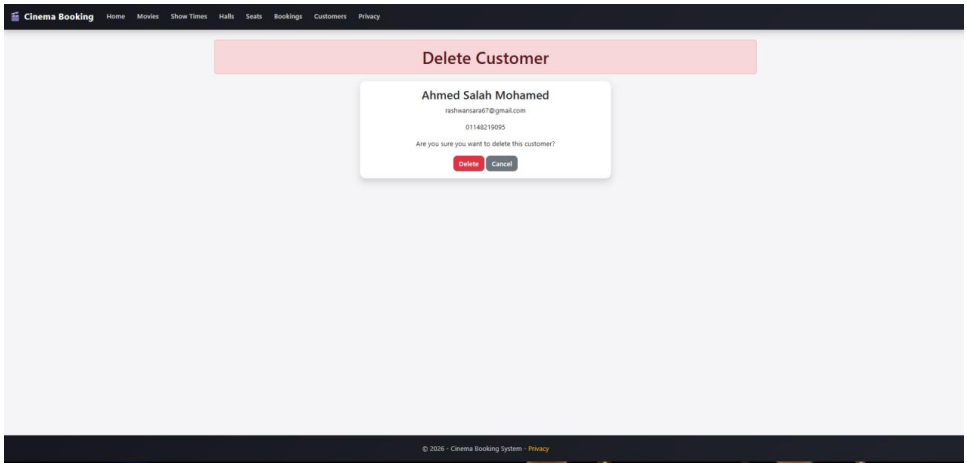

Edit form for updating a customer's name, phone or email (with confirmation field). Existing bookings stay attached to the customer by ID after the update.

Customers - Delete confirmation (Sara Rashwan)

Confirmation dialog before deleting a customer, summarizing their email and phone. Deleting a customer should also remove or block their related bookings.

Customers - Delete confirmation (Ahmed Salah Mohamed)

A second example of the delete-customer confirmation, for a different customer. Same flow and safeguard as the previous delete screen.
